

## uCop

uCop is an Umbraco CMS plugin that helps with website maintenance. The initial version shows breakdown of document types defined in a site together with some other static data, helping the editors and developers see the dependencies at a glance. The aim is to extend uCop to allow dynamic analysis of the site based on predefined rules, aiding the development and maintenance further. This can be used to evaluate the health of a site, or to enforce conventions and best practises.

### Usage

In the Umbraco admin menu, open the uCop section and select Website Structure. This is the only supported feature at the moment. Website Structure shows you your Document Type hierarchy with a list of templates, links, and properties associated with these document types.
