

## PublicMediaTree Installation Guide

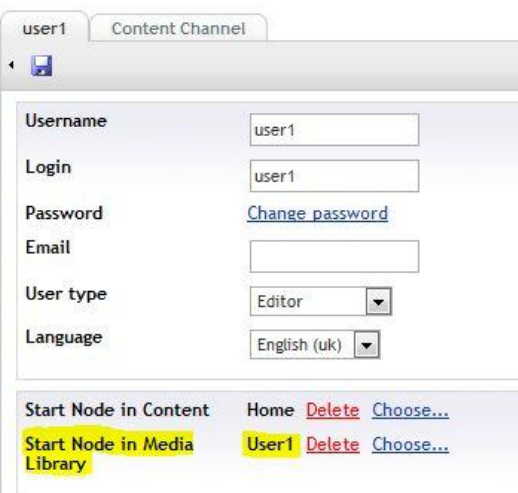

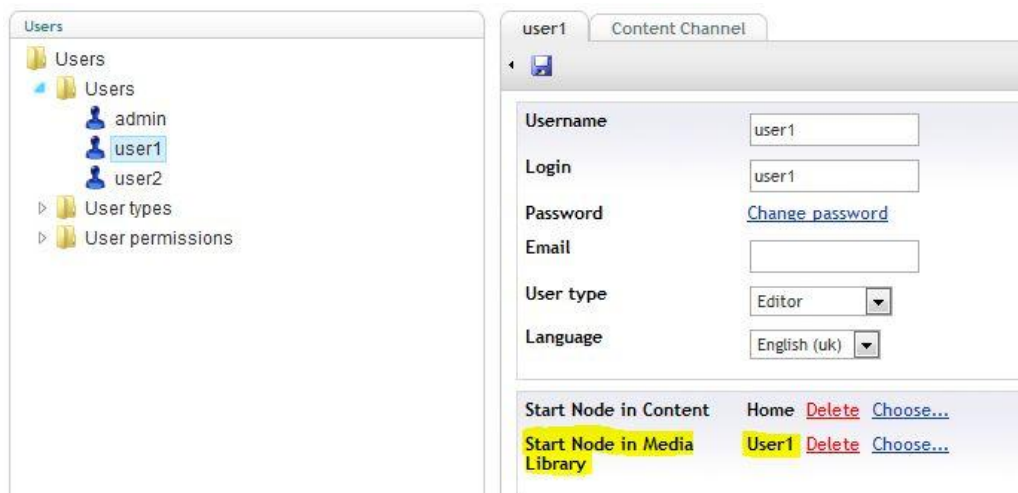

- 1) Install the *PublicMediaTree* package  
<http://our.umbraco.org/projects/backoffice-extensions/publicmediatree>
- 2) In the Media section, create a folder named "Public"

- 3) Open the Web.config and find the app setting *PublicMediaTreeNodeId*. Replace the value of this setting with the node Id of the public folder you just created.

- 4) In the User section, create a user that has a specific start node in the Media section.

- 5) Log in with the user you just created and in the Media section you should now also see the public media tree (next to the content within the user's start node)
