

uSiteBuilder Admin Package

Currently with uSiteBuilder the process of updating document types can be a frustrating one, with the library automatically installing an HTTP module to synchronise on app startup.

This package allows you to view the changes to the document types that you are about to make before applying them, and also provides the facility to export an existing set of document types to uSiteBuilder classes.

The package uses a modified version of uSiteBuilder and the `siteBuilderSupressSynchronization` application key must be set to True in the web config to suppress this automatic synching.

```
<add key="siteBuilderSupressSynchronization" value="true" />
```

The package is at a very early stage but will be extended to include:

- partial Document Type synchronisation
- extra information about the expected changes before sync
- Data Types
- Templates
