uCaptcha

uCaptcha is designed for people to customize their own captcha and render it on the fly, it creates a value, renders that in the captcha image and also saves the value to a session variable called 'captchaString' so you can check against it.

Using uCaptcha

To use uCaptcha, you can create an image in HTML and load it from 'http://yourwebsite/uCaptcha.ashx' it will display the captcha in the web page and add a session variable called 'captchaString' which you can use to compare against so see if the captcha the user has input is correct.

Help

uCaptcha is distributed under the MIT license which means it can be used for free and distributed in other works however you must provide acknowledgement in the credits.

For assistance with uCaptcha please post on the our.umbraco.org forums in the uCaptcha help section.
